Comments

The month of August was below the thirty-year average in both temperature and precipitation. More significant rainfall occurred only locally, positively influencing yields in those areas. Harvest began on August 18th in lower altitudes and around August 23rd in higher situated locations. The health of the hop plants is generally good with the exception of some areas that were damaged by red spider mite.

Based on the results available so far, the average yield for Saaz hops in the Saaz area is expected to be between 1.2 and 1.3 t/ha. The alpha acid content should also be average, with results averaging around 3.1% in dry matter (EBC 7.4).

The Sladek and Premiant varieties are scheduled for harvest in the coming days and a visual assessment suggests an average yield for both.
